AI System for SP Team

AI System for the Support Pets Team

Prepared by: Andrew Lermsider

Prepared for Review by: Ron Rechtman, Nicole Hedmark, Steven Biggs, Brian Harrigan, Lisa Pena, Jesse McGrath

Date: March 1, 2026

BACKGROUND — WHAT THIS TECHNOLOGY IS

Before we get into the plan, here's the context you need.

What I'm running personally: Over the past several months I've been running an AI system called **OpenClaw** on a dedicated Mac Studio in my office. Think of it as a personal AI chief of staff — it runs 24/7, knows our business inside and out, can browse the web, create documents, send messages, and take real actions. It's not ChatGPT. It's a fully customized AI agent built specifically for how I work.

The problem with scaling that to the team: The version I run requires a dedicated machine (Mac Studio or Mac Mini), technical setup, and full admin access. If we gave everyone their own version, we'd have 15+ machines to manage, no central control, and no way to prevent someone from accidentally (or intentionally) connecting it to systems they shouldn't touch.

The solution we're exploring: A cloud-hosted version of the same framework — one central server that we control, with individual AI assistants for each department. No separate devices. No one manages their own setup. The AI lives on our server, each person connects to it through Telegram or Slack (tools they already use), and we control exactly what it can and cannot access.

What it is NOT: - It is not connected to email - It is not connected to financial systems (Braintree, banking, payroll) - It does not have access to customer PII beyond what's needed for its role - It cannot send external communications on its own - It cannot make purchases or financial decisions

What it IS: - A smart, business-aware assistant for each department - Knows SP's brand, compliance rules, scripts, and active projects - Can search the web, draft documents, update Notion, and message within Slack - Can create, update, and manage tasks in **Asana** — for internal teams and external vendors - Fully auditable — every conversation is logged - Centrally controlled — we can change permissions or shut down any instance instantly

Think of it as giving each team member a highly trained assistant who only knows what they need to know, can only do what we authorize, and reports everything back to us.

WHERE THE TEAM ACCESSES IT — SLACK ONLY

The team's AI runs entirely inside **our existing Slack workspace**. No Telegram. No personal accounts. No separate apps.

Each department gets a dedicated bot inside Slack. Team members DM the bot directly — the same way they'd DM a colleague. Everything happens inside the system we already control.

Why Slack (not Telegram): - The team is already in Slack all day — zero learning curve - Ron (Slack admin) has full visibility into all bot interactions - An employee leaves or is terminated → disable their Slack account → AI access is gone automatically. One step, no loose ends. - All AI conversations are part of our existing Slack audit trail - We never need to give a team member a Telegram account or any external tool

What this looks like for an employee: They open Slack → DM their department's AI bot → type their request → get a response. Same as messaging anyone else in Slack. Done.

Asana integration — task management included:

One of the most practical use cases: the AI connects to Asana and helps each team member manage their own tasks and their vendors' tasks without leaving the conversation.

Examples of what this looks like:

- **Jesse / dev team:** *"Create a ticket for the login bug Selim found, assign to Alex, due Friday."* → Task created in Asana instantly. No manual entry.
- **Brian / marketing:** *"What's the status of the Q1 campaign tasks?"* → AI pulls open Asana tasks, surfaces what's overdue or blocked.
- **Lisa / partnerships:** *"Create a follow-up task for the property manager outreach we discussed, assign to Jesse's team."* → Done.
- **Nicole / ops:** *"What does the dev agency have open right now?"* → AI queries their Asana tasks and summarizes.
- **Steven:** *"What's overdue across all teams this week?"* → AI pulls a cross-team summary from Asana before the Monday review.

The AI doesn't replace Asana — it makes it faster to use. No one has to open the app, navigate projects, and manually create tasks. They tell the AI, it does it.

Ron controls it all from Slack admin: - Add or remove who can access each bot - Revoke a bot's permissions instantly - See full conversation history for any user - Shut down any bot in seconds if needed

This is the right architecture. Andrew uses Telegram for his own full-power AI system. The team uses Slack bots — controlled, internal, auditable, and contained to our existing workspace.

WHAT THIS IS

A dedicated AI system built specifically for Support Pets — not generic ChatGPT or Claude, but custom AI instances for each department that know our business, our brand, our workflows, and each team member's role.

This is not a pilot program or an experiment. This is infrastructure. The same way we built out our tech stack and CRM, we're building out our AI layer — department by department, with full control and accountability at every level.

THE PROBLEM WITH WHAT THE TEAM IS DOING TODAY

Some of our team is already using AI tools on their own (ChatGPT, Claude, etc.). That's not coordinated, it's not controlled, and it's not producing consistent results. Here's why:

- **No business context.** Every session starts from scratch. They re-explain Support Pets, the brand, the customer, the compliance rules — every single time.
- **No memory.** It doesn't know what was decided last week, what campaigns are running, what projects are in flight.
- **No tools.** It can give advice but can't act — can't pull data, update Notion, search the web for competitive intel, or create files.
- **No accountability.** We can't audit what they're asking, what it's producing, or whether it's helping or creating problems.
- **No standards.** Every person is using it differently. Some well, most not.

The result: AI is adding noise, not signal. That changes now.

WHAT WE'RE BUILDING

A dedicated server running one AI assistant per department. Each one is:

- **Role-specific.** The Marketing AI knows marketing. The CX AI knows customer service scripts and save flows. Each one is built for one job.
- **Business-aware.** Permanently loaded with SP brand voice, compliance rules, active projects, KPIs, and team context.
- **Memory-enabled.** Remembers past work, decisions, and context across every session.

- **Tool-enabled.** Can actually do things — web search, file creation, Notion updates, Slack messages — not just give advice.
- **Controlled.** Andrew and Ron can audit every conversation. Permissions are scoped per role. Access can be revoked instantly.

WHAT EACH DEPARTMENT GETS

📣 MARKETING — Brian Harrigan's Team

The AI knows: - SP brand voice and creative standards - ESA compliance rules (what we can and cannot say) - Active campaigns and what's performing - Target customer profile (dog owners, apartments, emotionally driven) - Lifecycle funnel stages and conversion triggers

What it does for the team:

Role	What they get
Brian	Campaign briefs, competitive research, weekly performance summaries drafted and ready
Paola / Letti	Lifecycle email drafts, A/B test hypotheses, segment analysis — already brand-compliant
Denise / designers	Creative briefs with specific direction, not vague asks
Ashlan / Vinnie	Social content outlines, caption drafts, content calendar suggestions
Jill	Email copy drafted to SP voice with compliance pre-checked
Anastasia	QA checklist generated automatically against brand and compliance standards

Before: Paola writes a lifecycle email. She opens ChatGPT, explains Support Pets, explains ESA, explains the customer, explains the offer — 20 minutes before she has a first draft.

After: Paola types: *"Draft a 3-email winback sequence for members who cancelled in the last 30 days, PP360 angle."* AI already knows all context. First draft in 60 seconds. She edits and ships.

Time saved per person per day: 1-2 hours minimum.

🎯 CUSTOMER EXPERIENCE — Bruce Boshouwers / Chris's Team

The AI knows: - Every save script and macro we've built - PP360 upsell triggers by customer segment - Landlord objection responses and legal citations - Escalation protocols - What Andrew considers a good outcome on a ticket

What it does for the team:

Agent types: *"Member says landlord denied ESA request in California, threatening to cancel."*

AI responds with: 1. Exact legal citation (FHA, HUD guidelines for CA) 2. What to say to the member 3. The save offer in order of effectiveness 4. Whether to escalate to legal review

Every agent performs like the best agent on the team. Consistency across every shift, every time zone.

Save rate goes up. Handle time goes down. No more tribal knowledge locked in one person.

⚙️ OPERATIONS — Nicole Hedmark / Kiri Frazer

The AI knows: - All active projects and their status - Vendor relationships and SLAs - Andrew's reporting preferences - What good looks like for each operational metric

What it does: - Weekly status reports compiled from Notion and drafted automatically - Project update summaries ready before every check-in - Vendor follow-up emails drafted on schedule - Kiri's operational runbooks surfaced instantly when needed

Nicole goes into her Monday review with everything already organized and summarized.

💻 TECHNOLOGY — Ron Rechtman / Jesse McGrath / Dev Team

The AI knows: - Current tech stack and architecture - Active development tickets and priorities - QA standards - Security and compliance requirements

What it does: - Technical spec drafts from a plain-English description - Bug triage — paste an error, get a diagnosis and suggested fix - Code review assistance for Richard and Isaac (QA) - IT ticket summaries for Jesse's team - Research on new tools, integrations, vendors — done in minutes not hours

Ron gets a CTO-level AI that knows the SP stack — not a generic coding assistant.

💰 MONETIZATION & PARTNERSHIPS — Lisa Pena

The AI knows: - Current partner relationships and deal terms - PP360 upsell and cross-sell triggers - Affiliate program structure and performance - Property manager, employer, and insurer partnership playbooks - Revenue targets and pipeline status

What it does: - Partner outreach emails drafted and personalized at scale - Deal memo templates populated from a quick brief - Partnership pipeline summaries ready before every meeting - Market research on new partnership categories — done in minutes - Jesse's dev team project briefs written from Lisa's plain-English asks

Lisa goes from idea to outreach-ready in the time it used to take to open a blank doc.

🔧 PROJECT COORDINATION — Jesse McGrath / Dev Team

The AI knows: - Active development tickets and their status - SP tech stack and architecture - QA standards and testing protocols - Vendor relationships (dev agencies)

What it does for Jesse's team:

Role	What they get
Jesse	Project status summaries, stakeholder updates drafted, ticket prioritization recommendations
Axel / Selim	IT ticket triage — paste an issue, get a diagnosis and resolution path
Dev team (Alex, Jeff, Fraga)	Technical specs generated from plain-English requirements, code review assistance
Richard / Isaac (QA)	QA checklists auto-generated per feature, bug report templates, regression test suggestions
Dev Agencies	Brief documents generated instantly — no more back-and-forth to define requirements

Before: Jesse spends 2 hours writing a dev brief for an external agency, explaining context from scratch.

After: Jesse describes what's needed in plain English. AI drafts the full technical spec with acceptance criteria, edge cases, and timeline estimate in 5 minutes.

📋 CHIEF OF STAFF — Steven Biggs

The AI knows: - Andrew's priorities and communication style - All cross-functional projects - Who owns what and what's blocked

What it does: - Morning briefings compiled from all department inputs - Meeting prep — agenda, open items, decisions needed — ready before every exec meeting - Follow-up tracking — nothing falls through the cracks - Draft Andrew's comms when needed (internal memos, partner outreach, etc.)

Steven's AI is the connective tissue between all departments.

WHAT THIS IS NOT

This is not a tool for doing less work. It is a tool for doing better work faster.

Every AI instance is configured with hard rules:

1. **Demands specificity.** Lazy prompts get pushed back. “Write me an ad” → AI asks: “What’s the angle, what’s the offer, what’s the audience segment?”
2. **Output only.** Every interaction ends with a deliverable — a draft, a summary, a recommendation — not a discussion.
3. **No hallucination.** If it doesn’t know, it searches. It never makes things up.
4. **Signal-only.** No filler, no “great question” openers — just work.
5. **Business-first.** Every response filtered through what’s good for SP, not just what’s technically correct.

THE INFRASTRUCTURE (Ron — Technical Spec)

```
DEDICATED VPS ($50-100/month)
│
├── Marketing AI Bot        →  Brian's team (Slack DM)
├── CX AI Bot               →  Chris's team (Slack DM)
├── Ops AI Bot              →  Nicole/Kiri (Slack DM)
├── Tech AI Bot             →  Ron/Jesse/Dev team (Slack DM)
├── Monetization AI Bot     →  Lisa Pena (Slack DM)
└── CoS AI Bot              →  Steven (Slack DM)

[Andrew's Mac Studio — separate, untouched]
└── Clouis → Andrew only (Telegram)

ANDREW'S MAC STUDIO (separate — untouched)
└── Clouis (full power, Andrew only)
```

Stack: - OpenClaw (open-source AI agent framework, same as what runs Clouis) - One bot instance per department — isolated, scoped, controlled - Connects to: Telegram, Slack, Notion, web search - All conversations logged to central audit store

Permissions per bot (scoped):

Capability	Marketing	CX	Ops	Tech	Monetization	CoS
Web search	✅	✅	✅	✅	✅	✅
Notion read	✅	✅	✅	✅	✅	✅
Notion write	own pages	tickets	own pages	own pages	own pages	✅
Asana (own team tasks)	✅	✅	✅	✅	✅	✅
Asana (vendor tasks)	✅	❌	✅	✅	✅	✅
File creation	✅	❌	✅	✅	✅	✅
Slack	✅	✅	✅	✅	✅	✅
External comms	❌	❌	❌	❌	❌	❌

Capability	Marketing	CX	Ops	Tech	Monetization	CoS
Financial data	❌	❌	❌	❌	❌	❌
Browser automation	❌	❌	❌	❌	❌	❌

No bot touches financial data. No bot sends external communications. No bot has access to another department's data.

COST

Item	Monthly Cost
Dedicated VPS (server)	$50-100
AI model costs (per bot, per user)	~$20-40/user/month
Total for 6 bots / ~20 users	**~$400-800/month**

For context: that's less than 2 hours of any senior employee's time. And it gives every person on your team 1-2 hours back per day.

Projected ROI: 15 team members × 1 hour/day saved × 20 days × $30/hr blended = **$9,000/month in recovered capacity** for $350-700 in cost.

ROLLOUT PLAN

Phase	What	Owner	Timeline
Phase 1	VPS setup, deploy framework, Marketing + CX bots	Ron	Week 1
Phase 2	Load SP knowledge base into each bot (brand, compliance, scripts)	Brian + Bruce review	Week 1-2
Phase 3	Pilot with Brian's team + Chris's team	Brian, Bruce	Weeks 2-4
Phase 4	Measure: time saved, output quality, save rate	Nicole	Day 30
Phase 5	Expand to Ops, Tech, CoS bots	Ron	Month 2

Start small. Prove it. Scale it.

WHAT WE NEED FROM EACH OF YOU

Person	Action
Ron	Provision VPS, deploy OpenClaw, set up first two bots (Marketing + CX)
Brian	Define the 5 most common tasks his team repeats — these become the AI's priority use cases
Nicole	Identify the 3 biggest time sinks for Ops — these get automated first
Steven	Define what a perfect morning briefing looks like — AI builds it daily
Lisa	List top 3 partnership outreach workflows — AI drafts and scales them
Jesse	Document the most common dev brief / ticket type — AI generates the template

---

BOTTOM LINE

We have a $40M business running on people doing repetitive, high-volume cognitive work that AI can assist with in seconds. We're not replacing anyone. We're making every person on this team perform at the top of their ability, every day, with no context lost and no tribal knowledge bottlenecks.

This is not optional infrastructure at the $40M → $250M scale. This is table stakes.

First step: Ron + Brian sync this week to kick off Phase 1.
